

Building Human Capital for Digital Financial Governance: Enhancing Transparency and Accountability in Pakistan's Public Sector

Digital governance is now a key enabler of public finance management systems for accountability and transparency at the global level. The preparedness of the workforce for automation and digital infrastructure is what will make or break the success of these initiatives, as governments continue to invest in them.

According to the United Nations E-Government Survey 2024, more than 190 countries now utilize digital platforms to support public administration and service delivery, highlighting the growing importance of digital governance worldwide.

This article examines the potential benefits of human capital development for enhancing digital financial governance in Pakistan and provides relevant recommendations for the policy makers and leaders in the public sector.

Introduction

Accountability and transparency continue to be essential components of good governance. The public expects public institutions to be responsible in the use of their resources, effective in their services, and providing timely information. As a result, governments all over the world have embraced digital technologies to enhance oversight procedures and update financial management systems.

Information and communication technologies (ICTs) have undergone an unprecedented rate of development in the last few decades, affecting the way governments communicate with the public, manage public budgets and deliver public services. Public-sector businesses have been able to increase operational efficiency, decrease bureaucratic delays, fortify monitoring systems, and boost public trust through increased information accessibility and openness thanks to digital governance initiatives. Citizens' awareness and connectivity are driving expectations for accountable, responsive and data-driven governance for governments, which will require them to modernize their financial and administrative management systems. As citizens become more aware and connected, their expectations are rising for accountable and responsive and data-driven governance, compelling governments

to modernize their financial and administrative management systems.

Project to Improve Financial Reporting and Auditing (PIFRA), Integrated Financial Management Information System efforts, digital tax administration, and e-procurement systems are just a few of the reforms Pakistan has implemented.

The modifications are a part of a larger initiative to improve public financial management and guarantee that governance procedures are in line with global norms for transparency and accountability. Digital platforms and automation can help to enhance the quality of financial reporting by public institutions, enable real-time reporting, reduce the risk of fraud and corruption, and promote evidence-based decision-making. Such initiatives are particularly vital to effective resource management and public trust in government institutions, which are critical for long-term and sustainable economic and social development, especially in emerging markets.

The PIFRA effort helps the federal government, provincial government and district government to perform the functions of providing computerized accounting and financial reporting to the number of billions of rupees in public expenditure on an annual basis.

Digital financial governance isn't solely about technology, though. Qualified human resources to operate, understand and apply digital information are important factors affecting the effectiveness of systems such as PIFRA and IFMIS. Public servants need to be technologically literate, analytical and ethical in the ever-digital working environment. Human capital development has been a major focus of investment for governments to benefit from digital transformation projects.

But technology alone can't achieve transparency. For sustained benefits, skilled workers, inspirational leadership and an innovative and accountable corporate ethos is essential. Furthermore, whether or not digital governance reforms provide the desired results depends critically on corporate culture and leadership. Technology may be used as an enabler of good governance rather than just an administrative tool in an atmosphere created by leaders who support innovation, encourage ongoing learning, and encourage responsibility. Thus, improving human capital preparedness is both a governance requirement and a challenge for workforce development. To facilitate transparency, accountability and efficiency in the long term in the public finance management system of Pakistan, it is important to build a digitally capable public sector that is capable of adapting to the evolving technology demands.

Public Financial Management and Digital Governance

Digital governance is defined as the application of ICTs to enhance the performance of public governance and service provision. In the public sector, digital systems can be used for budget, accounting, procurement, audit, and reporting. Paper-based systems are prone to inefficiencies, delays and lack of transparency. Digital systems generate an audit trail, better information accessibility, and less opportunities for manipulation. These also provide decision makers with the data to track finances in real time and make better use of resources.

According to the World Bank GovTech Maturity Index 2024, governments that successfully integrate digital financial management systems report improved budget monitoring, enhanced transparency, and greater citizen trust through real-time access to government financial information.

Addressing the Human Capital Challenge

Organizations undervalue the human aspect of change, which presents challenges for many digital transformation initiatives. Workers might not be adequately trained, be resistant to new systems, or lack digital capabilities. At many institutions, workforce development is not as emphasized as technology acquisition. The World Economic Forum's Future of Jobs Report 2025 estimates that nearly 39% of workers' core skills will require updating or transformation by 2030 due to technological advancement and digitalization.

As a management perspective, it is essential to have competency development, leadership commitment,

employee engagement and continuous learning to support the digital transition. It is certainly an organizational reform project that requires recognition by public institutions for the use of technology.

The following priorities in HRM for Digital Governance will be discussed:

1. Digital Skills Development

Employees must also be knowledgeable in digital literacy, cybersecurity awareness, data management and technology-informed decision making. The World Economic Forum identifies analytical thinking, technological literacy, AI and big data capabilities among the fastest-growing skill requirements globally.

2. Readiness for Leadership

Communicating the goal of digital transformation, handling opposition, and fostering an accountable culture are all crucial tasks for leaders. Research by the Organization for Economic Co-operation and Development indicates that leadership commitment is among the strongest predictors of successful public-sector digital transformation initiatives.

3. Management of Change

Employees can adapt to new procedures and systems using the support of structured procedures for change management. Studies suggest that a significant proportion of digital transformation projects encounter implementation difficulties due to organizational resistance rather than technological shortcomings.

4. Management of Performance

Rewarding innovation and continuous improvement, and aligning performance with digital governance objectives are essential for businesses. Performance management systems linked to digital governance objectives can improve employee engagement and accountability, particularly in public-sector organizations undergoing reform.

Pakistan's Way Forward

Pakistan should do the following to improve digital financial governance:

- Develop a national strategy for digital competence in public services.
- Increase government personnel' access to certification and training options.
- Increase the links between governmental bodies, professional associations and universities.
- Promote leadership development programs that focus on digital transformation.
- Encourage employees to appreciate education, teamwork, and responsibility in the workplace.

In Pakistan, millions of people are working in public sector organizations, whether federal, provincial or local, to work in the digital governance environment, and therefore, preparedness of workforce is a significant determinant of the effectiveness of digital governance.

Investments in technology and human resources are required for Digital Governance as observed in countries such as Estonia, Singapore and the UK. Estonia is one of the best digital governments in the world, with nearly all public services available online, yet the country must not neglect to incorporate the digital readiness of its citizens and workforce into its technology infrastructure. They highlight their organizations' experiences, where worker preparation has frequently been shown to be crucial to the success of transformation initiatives.

Conclusion

Pakistan's public finance management systems have the potential to improve efficiency, accountability, and transparency with the help of digital governance.

However, there are more factors than technology. Organizational culture, leadership preparedness and human capital preparedness are key areas that need to be prioritized.

Multiple global indicators show that countries that invest in strengthening the capabilities of their workers and invest in the digital infrastructure, achieve superior outcomes in terms of public trust, transparency, and service delivery. Investment in people and technology can enhance the strength of Pakistani institutions, build public trust and better governances.
